DSC550 - Data Mining Coursework Project :

Trump Tweet Deets... 2014-2021

****

==========

Requirement...

==========

You have made it to the final weeks of the course and the time has come to submit your final project milestone! The only new requirement for the final milestone is to include a conclusion/summary. At a minimum make sure that you answer the following questions:

- What does the analysis/model building tell you?
- What are your recommendations?
- How would you pitch this business problem to a group of stakeholders to gain buy-in to proceed?
- Why should someone in the business care about this solution?
- What are some of the potential challenges or additional opportunities that need to be explored?

You will need to submit the following as part of your final submission for Milestone 5:

- Case Study Report
- Introduction
- Organized and Detailed Summary of Milestones 1- 3
- Business Problem/Data
- Graphical Analysis
- Dimensionality & Feature Reduction and Feature Engineering
- Model Selection & Evaluation
- Conclusion (Findings, Summarization)
- Code – either via PDF or a Notebook

Any additional supporting documents Your case study report should be a minimum of 3-5 pages, along with visuals created to support your analysis. Submit Milestone 5 to the submission link.

==========

Motivations...

==========

Source: May 04, 2021 Donald Trump's 'social media platform' has launched and it's just a blog

After months of promising his own social media network for banned posters, former President Donald Trump on Tuesday launched a new section of his website — essentially a standard-issue blog.

The "platform" is styled like of Twitter but hosted as a running blog of Twitter-length commentary from Trump. People can sign up for post alerts on the platform through their email and phone numbers and are allegedly able to like them, although that function doesn't appear to work as of publication. Users are also allowed to share Trump's posts on Facebook and Twitter. The Twitter sharing option doesn't currently work, but Facebook's does allow people to share Trump's posts.

"Generally, sharing content from the website reference is permitted as long as the material does not otherwise the Twitter Rules," a Twitter spokesperson told *The Verge* on Tuesday. Facebook did not immediately respond to a request for comment.

THE NEW "PLATFORM" IS EFFECTIVELY A BLOG STYLED LIKE A GENERIC VERSION OF TWITTER

Even though the platform formally launched on Tuesday, there are posts dating back to March 24th. Trump's latest post is a video advertising his new platform, calling it "a place to speak freely and safely, straight from the desk of Donald J. Trump." According to *Fox News*, Trump will "eventually" be able to communicate with his supporters directly, although it's not clear how that will happen. Trump's press office did not immediately respond to a request for comment

==========

Problem Definition...

==========

Now in 2021, Trump stands banned from some social media platforms (Twitter, Facebook, et al) – however his usage of Twitter as a platform was unprecedented, more so as a leader of free world. He used tweets to praise, cajole, entertain, lobby, curse – he used twitter to amplify his scorn – which followers might refer to as "speak his mind". Trump's Twitter theatricals led to this rich repo of "insults" targeted at a variety of stakeholders.

Even after the end of presidency, Trump theatricals though has lost a bit of steam being off Twitter, yet this hasn't necessarily translated to loss of "popularity". Trump, even today, does have huge enviable supporter base, although he is barred from Twitter and Facebook. To me, this likens to a "Politician Rockstar" -- who has a fan-base... his cult definitely has the potential of getting emulated and opportunity to encash (if the params/ variables are designed/ decoded well enough)

I see Trump's tweeting behavior as a business opportunity, which any politician may try to replicate in future. I found the tweeting phenomenon "interesting", since the source was "the most powerful (political) person on earth", and I was overdosed with data mining concepts ;-) ... so this was destined to be an opportunity to merge the two events.

The scenario I imagine is sometime in future (say 2040):

- Trump's tweeting, theatricals, insults, etc are a model for politicians to replicate -- but minus the human-brain space/ effort

- What if a machine/ a code can perform the same theatricals for the next US Presidential candidate i.e. generate similar levels of engagement aka divisiveness, hype, confusion, whims, fancies, bursts -- create the *"next Trump"*
- Business Opportunity: Can I develop a predictor / recommendation engine that ranges amongst the subject areas of Trump's targets. If I can somehow identify the subjects or personas or patterns that Trump targeted, I can probably extrapolate it to current timeline to carve out a `tweet bot strategy` for the presidential campaign and maybe tenure too

Well, from an academic exercise aspect, recommendations/ predictions in reality can be applied to any area -- say stocks, exchange indices, commodity prices, currency fluctuations, international trade volumes, etc. My point is I am assuming that these Tweets can impact relations and affect real business amongst stakeholders, thus has a $$ value associated, which I am trying to encash through this academic pilot project.

==========

Dataset...

==========

As a political figure, Donald J. Trump used Twitter to praise, to cajole, to entertain, to lobby, to establish his version of events — and, perhaps most notably, to amplify his scorn. This list documents the verbal attacks Mr. Trump posted on Twitter, from when he declared his candidacy in June 2015 to Jan. 8, when Twitter permanently barred him.

Based on an analysis of tweets since Mr. Trump declared his candidacy for president, on June 16, 2015. Retweets are not included. Some names may be omitted. This was first published in 2016; some of the people insulted have since died, and some people's titles or public roles have changed. Source: Trump Twitter Archive

==========

Analysis Outline / Objectives...

==========

1. Dataset Exploration and Cleaning
    - Who - targets?
    - How - frequent?
    - Most used words?
    - Most frequent targets?
    - What changes is you remove grammar from vocab? (prepositions are junk ! -- is this true?)
2. LDA & Sentiment analysis
    - Sentiment Analysis
    - Bag-of-Words to serve as a dictionary
    - does token-words change after cleansing?
3. Model selection/ evaluation and feature engineering
4. Demo of tweet prediction

Refer "Workings Detail" *below* for details of outline of the implementation...

[A] Let's read/ process

 # 1.a - Start with reading/ cleaning / processing the csv file...

[A.1] Data Cleaning

 # 1.b - If we cleanse raw data i.e. rationalize the words, does any of our prior data exploration change/ deviate significantly?

Observations -

- 1.a Reading the csv is fairly straightforward, I did have to ignore/suppress (library/package related) warnings
- 1.b Once my data does not contain any unwanted characters, I will perform Lemmatization to reduce inflected words to their root words. With data cleaning, formatted - cleansed outputs seem to nullify the grammatical aspects of the tweet, and the token-words are just the dictionary of words (*like a bag-of-words?*)
- 1.b `top-insults` what does the vocabulary of world's most-powerful-man consist of?
- 1.b `about` is the most used word in Trump tweets, with `absurd` following behind 2nd -- quite behind when compared across the entire tweeting window 2014-2021

[B] Okay, now let's try to see if the dataset has any patterns

 # 2 - patterns/trends with tweets -- *can the dataset answer following questions*

- does the count / frequency of tweets change/ spike or remain consistent over the entire period?
- who are the targets? how does the target trend change over the years? Are there any repeat / persistent targets in the tweets? does he really target or is it hoot-and-scoot for getting attention from his supporters? *(EDA - visualize Trump tweets/ targets)*

Observations -

- except for 2017, count of tweets has increased for Trump during the tenure (P.S. Trump did delete/ modify a lot of his tweets, this dataset doesnt account for deleted tweets, which were probably a recurring behavior for Trump mid-presidency?)

- `most-insulted Trump targets : media , democrats , hillary , russia , joe-biden` were primary trump targets across the 2014-2021 tweeting window

- Tweet count `Insults-per-target` : Trump wasn't a hoot-and-scoot type tweeter, he was persistent for some targets, and mostly he was deliberate...
- *thinking more of this - why do I say across 2014-2021, what if the scope was reduced to each year between 2014-2021 period* will the targets change across years? is it only Trump or does he have additional vocabulary due to an advisor? since the tweet volume is changing rather increasing... is Trump really doing all this ? or did he deploy a bot/program to do the 'Trump-thing' hereon (*wow! so there's a market for this kind of bot-behavior...*)

[C.1.1] Exploratory Analysis

 # 3.a - Sentiment analysis | token-words

Observations -

As we can see, more positive tweets have been tweeted since 2017. There's certaintly a peak of negativity from 2014 to 2015 which has been mantained untill 2017 but then the negativity decreases a lot and very abruptly. But as we can see in the next cell, the number of tweets per year have been increasing since 2014. Of course, there are not much 2021 tweets given elections and Twitter ban, but in any case there's a tendency of lowering the negativity.

[C.1.2] Sentiment Analysis - VADER

 # 3.b - "Trump faces Vader !" *vaderSentiment analysis* -- VADER *Valence Aware Dictionary and Sentiment Reasoner*

VADER (Valence Aware Dictionary and Sentiment Reasoner) is a lexicon and rule-based sentiment analysis tool that is specifically attuned to sentiments expressed in social media. It is used for sentiment analysis of text which has both the polarities i.e. positive/negative. VADER is used to quantify how much of positive or negative emotion the text has and also the intensity of emotion. Advantages Here are the advantages of using VADER which makes a lot of things easier: It does not require any training data. It can very well understand the sentiment of a text containing emoticons, slangs, conjunctions, capital words, punctuations and much more. It works excellent on social media text. VADER can work with multiple domains.

Observations -

- *pos*: The probability of the sentiment to be positive.
- *neu*: The probability of the sentiment to be neutral.
- *neg*: The probability of the sentiment to be negative.
- *compound*: The compound score is computed by summing the valence scores of each word in the lexicon, adjusted according to the rules, and then normalized to be between -1 (most extreme negative) and +1 (most extreme positive).

Notice that the *pos*, *neu* and *neg* probabilities add up to 1. Also, the *compound* score is a very useful metric in case we want a single measure of sentiment. Typical threshold values are the following:

- *positive*: compound score>=0.05

- *neutral*: compound score between -0.05 and 0.05
- *negative*: compound score<=-0.05

Now with this results we'll see what's Trump's evolution by plotting the compound sentiment score by year.

[C.1.3] Sentiment Analysis - WordCloud

 # 3.c - WordCloud *word visuals*

Observations -

- The generated images are somewhat aligned with EDA analysis done earlier i.e. `media` , `democrats` , `hillary` , `russia` , `joe-biden` in descending order are the `most-insulted targets` . The size of these *names* on the WordCloud image indicates the relevance / frequency of target. This is very much similar to observations made with the dataset exploratory trends.
- If we see the words - size and intensity `fake` , `new` , `witch` , `hunt` , `crooked` , `people` are some of the most used words across the tweets
- Wordcloud results are aligned with Trump's image I witnessed on news channels, analyst coverages and other media portals including social media platforms

[C.2] Latent Dirichlet Allocation (LDA) Modeling

What is the core of Trump insults? Can these tweets be programmatically organized into topics? Can patterns be discovered that may be useful for further analysis/modeling?

Observations -

Categorising words into topics, we had discreet tweets which when modelled into topics are indicated through distinct bubbles on left which are distinguished with varied intertopical distance amongst other bubbles.

[D] Model Selection and Evaluation

Why choose Random Forest ?

The term “Random Forest Classifier” refers to the classification algorithm made up of several decision trees. The algorithm uses randomness to build each individual tree to promote uncorrelated forests, which then uses the forest's predictive powers to make accurate decisions. In this instance, although source of tweets is Trump, the targets are assumed to be uncorrelated given reality of Trump whims.

For model evaluation, I did get reasonable high accuracy and precision scores. I don't think model development applies (or I couldn't make much headway in this aspect of the dataset usecase/activity). My initial goal was to use the tweet topics as features with the target as the impact variable. So my presumed theory I was aiming for is with a bag-of-words and having known historical targets, the model would predict who would be the next target. Been thinking through, i realized my folly and pivoted to drop the feature selection/ engineering aspect of model. Instead I pivoted to tweet generating/ predicting using FastAI. So the bag-of-words tries to image a persona,which is the desired behavior of a tweet bot.

[E] DEMO : Tweet Generator using FastAI

As a selling proposition for this product This BOT-like product attempts to offload the "thinking" (aka targeting/ insulting?) abilities to the bot along with features like sentiment (bag-of-words), and choice of target. Well, the choice of target is subject to many external factors in reality, but this is just an academic scope, so a theoretical exercise aiming to mimic Donald Trump's theatrics ;)

Business Plan / Pitch -

- I have assumed this dataset `Trump Tweet 2014-2021` to be an indicator of Trump's 'real' persona -- which is desired by a future USA president. A president-in-future *(say 2050?)* wants to replicate Trump's theatricals in spirit, but doesn't want to actually use his own brains, rather led a machine trained model do it for him -- its a **`Trump T-BOT`**
- `Trump T-BOT` is trained on variety of Trump tweets or can use a variety of "mood" or "sentiment" or "tone" as desired by its user. I have used a language based package called FastAI (text based classification model) for tweet generation. I will be training this model with different versions of Tweet to observe the verbiage of tweets and its tone changes
- How is this relevant? What is the use of all this?
  - To imagine a situation say 2050, the president of US at this time wants to "use" a bot to create somewhat similar social media theatricals. I've assumed that Trump's tweet activity as a desired/ model behavior for future US presidents, which can be offloaded to a bot that is pre-programmed per a desired prior persona.
  - Why only Trump tweets? We can actually pick any such character -- who people would desire to replicate. And to build Tweet-BOT product which specializes in pick-a-persona and then delivers *'cruise-mode'* for twitter/ social media bursts
  - Prior analyses help in identifying the tone, assigning the right sentiment / model score that decides on the controlling limits and programmatic controls with the model
  - Valence Aware Dictionary and Sentiment Reasoner (VADER) Sentiment Analysis for trend of positive, negative sentiment over years. Random Forest and generative statistical modeling -- Latent Dirichlet Allocation (LDA) analysis. These analysis, observations are done for the scope of academic exercise. However at scale, and with due diligence to inputs and control params can form the requirement skeleton for a social media bot which intends to replicate Trump's Twitter theatricals

- Demonstration of a tweet generator (using FastAI). Compare / highlight the differences in output/ tone based on the training dataset.
  - *controlling the training dataset* -- in order to meet desired notes/ sentiments in the generated tweet

Observations -

When the model is trained on the dataset of Trump's own tweets, the generated tweet seem to match Trump's public image. With the different dataset, the tweets didn't exactly align or doesn't seem to be perceived the same way as intended. The difference in either datasets apart from the volume of rows, is the source of truth. Media tweets of trump are part of the dataset where the generated tweets seem "dreamy" unlike Trump

- I extracted a random twitter dataset from variety of sources.. It includes a healthy mix of his tweets as well as tweets/ snippets about him (primarily from media outlets). My idea of this exercise is to demonstrate the impact on the tone/ lexicon of the tweet when the model is trained on this *mixed* tweet dataset vis-a-vis the tweet-insult dataset

- Training the FastAI model on the datasets is a tedious task. For a ~40k tweet dataset, running 5 iterations took over 2.5 hours with a Macbook Pro machine, indicating the compute process intensity/latency of the predicting model

- The model seems very disconnected to 'real' Trump when trained with *mixed* tweet dataset. The T-BOT spit out : `you are LAT.MS correctly , i think` ; while when the model is trained on tweet-insult dataset it spits out : `know what to do with them` -- quite a proximation of the real verbosity

==========

Conclusion...

==========

Imagine a world, where a tweet can impact markets, indices and stocks; affect trade relations, commodity prices -- a tweet that can make or mar business - real business dollars. What if this tweet can be controlled so that the impact too is patterned/ predictable. So, assume a future politician needing to replicate Trump theatricals, but instead of actually using own mind-space or brainpower, the person intends to try/ trust a machine to do this 'mindful' significant job -- it means real business dollars.

This imagination/ motivation for this task was driven by Trump's own social media platform launch in May 2021 - which seems like a repository of his tweets/anecdotes, and glaringly lacking the engagement aspect associated with social media platforms. *Its ironic that as of today, Trump's platform has shutdown.*

I started off the task with aim to analyze the dataset, find variables to control, try to programmatize my approach for replicability, accuracy and explainability aspects. LDA modeling, sentiment analysis ... bag-of-words are aimed at explaining the dataset - key targets, insult keywords, most-insulted targets. I started off random forest modeling trying to identify key features in the model, which I can use for affecting the impact variable. Feature engineering -- this is one aspect of the exercise which I could have dug deeper with more time, this would have helped me in identifying control parameters for the model. I did attempt to demo *a very basic* usecase of how a controlled dataset predicts / directionally mimics the character persona. My intention with the FastAI snippet to generate tweets, was to get a stakeholder buy-in with the end state of the model. The next step to action it would be a scheduler which generates text at a politician/ aspirant controlled cadence.

Given academic scope of the task, each of the analyses scopes has ton of opportunity of being iterated and scoped to elaborate plans. However I limited it to the course tenure and the milestone objectives.

Name: insult, dtype: object
```

Observation ^ --

- if we compare "raw" and "clean" -- tweets and insults -- (just visual inspection),
- we see the pruning has happened with grammar aspects
- the words indicating the target, the sentiment are part of the acceptable tweet and insult tokens

In [39]:
```
#Tokenization using count vectorizer
count_vect = CountVectorizer(ngram_range=(1,1))
token = count_vect.fit_transform(tweet_df_lemma)
token
```

Out[39]:
```
<10358x8977 sparse matrix of type '<class 'numpy.int64'>'
        with 301429 stored elements in Compressed Sparse Row format>
```

In [40]:
```
print('Total number of tokens/words in all the tweets - ', len(count_vect.get_feature_names()))
```

```
Total number of tokens/words in all the tweets -  8977
```

Top Insults

Fine... so many insults... its Trump.. what else should we expect from "the entertainer", except that he is kind-of-the most-powerful authority on the planet, plus all the whims and theatricals - a really tempting prime time episode, but its the US presidency with the whole world watching agape

In [41]:
```
# identify "Top Insults" i.e. impactful insults? Frequently worded insult? Target scoring?
# bag of words/ LDA for the tweets
```

#5a. -- Workings Detail... Ref Section Heading: [E] DEMO Tweet Generator

==========

DEMO : Tweet Generator using FastAI

Broadly, this is the summary of actions...

- First I will use a `different Trump-Tweet dataset` as training data input for generator
- Subsequently , I will use the `Trump-Insult dataset 2014-2021` to train the generator and see the diff

- `different Trump-Tweet dataset` is sourced from variety of sources, and includes a healthy mix of his tweets as well as about him (primarily from media outlets). My idea of this exercise is to demonstrate the impact of the insult dataset on the model.

P.S. Eventually these datasets are used for developing a BOT -- "Tweet BOT" which can tweet / target based on its persona analysis/ model training efficacy

```
0                  be sure to tune in and watch donald trump on late night with david letterman as he presents the top ten list tonight
1    donald trump will be appearing on the view tomorrow morning to discuss celebrity apprentice and his new book think like a champion
2                                        donald trump reads top ten financial tips on late show with david letterman link - very funny
3                                                    new blog post celebrity apprentice finale and lessons learned along the way link
4                          "my persona will never be that of a wallflower - i'd rather build walls than cling to them" --donald j. trump
Name: content, dtype: object
```

Preprocessing the texts finally:

In [114…]
```
for i in tqdm(train.index):
    train.loc[i] = preprocess(train.loc[i])
```

```
100%|████████████████████████████████████████████████████████████████████████████| 43352/43352 [00:04<00:0
0, 9907.83it/s]
```

Grabbing the Dataloader:

In [115…]
```
train = pd.read_csv("./train.csv")
```

In [116…]
```
dls = TextDataLoaders.from_df(train, path="./", text_col='content', valid_pct=0.3, is_lm=True)
```

Model -- trained on `different Trump-Tweet dataset` ...

In [118…]
```
model = language_model_learner(dls, AWD_LSTM)
```

100.00% [105070592/105067061 00:03<00:00]

In [119…]
```
model.fit_one_cycle(5)
```

epoch	train_loss	valid_loss	time
0	5.119482	4.483339	25:30
1	4.346421	3.879691	48:47
2	4.088033	3.721125	25:37
3	3.990300	3.670313	26:11
4	3.985085	3.663576	25:41

It took a while ~2+ hours to train the model, which seems reasonable given the compute resources available for 43k rows in the training dataset for 5 cycle iterations. I had been watching movie simultaneously -- who you know how resources were used in parallel

Tweet Generating / Predicting using `different Trump-Tweet dataset`

Finally, "the moment of truth"...

for a pattern as "usa is greatest"

In [120…]
```
model.predict("usa is the greatest ", n_words=7)
```

Out[120…]
```
'usa is the greatest member and 1 to 5 women can'
```

well... let's now see what a counter-narrative were to say... a diff version?

In [121…]
```
model.predict("i think i am ", n_words=7)
```

Out[121…]
```
'i think i am going to win , but it is'
```

lets see fake news as input...

In [122…]
```
model.predict("you are fake news and you", n_words=7)
```

Out[122… 'you are fake news and you are LAT.MS correctly , i think'

In [123…
```
model.predict("i love ", n_words=15)
```

Out[123… 'i love that fact ! The term was always building for me , and i felt'

seems like Trump (according to this dataset) was like **dreamy... ?**

Let's see now if the model were to be trained on his 2014-2021 tweet dataset how it would spit out...

Now re-do the steps using FAST AI with `Trump-insult dataset 2014-2021`

In [127…
```
# intentionally taking Tweet and not insults, since I dont want to bias/ influence the model
# rather changing the tweet source from a mix of outsider + self to self alone
train_orig = df['tweet']
train_orig.head(3)
```

Out[127…
```
0    Can you believe this fool, Dr. Thomas Frieden of CDC, just stated, "anyone with fever should be asked if they have been in West Africa" DOPE
1    Can you believe this fool, Dr. Thomas Frieden of CDC, just stated, "anyone with fever should be asked if they have been in West Africa" DOPE
2                      Big time in U.S. today - MAKE AMERICA GREAT AGAIN! Politicians are all talk and no action - they can never bring us back.
Name: tweet, dtype: object
```

In [128…
```
train_orig.to_csv("./train_orig.csv")
```

In [129…
```
for i in tqdm(train_orig.index):
    train_orig.loc[i] = preprocess(train_orig.loc[i])
```

```
100%|██████████| 10358/10358 [00:02<00:00, 4594.71it/s]
```

In [130…
```
train_orig = pd.read_csv("./train_orig.csv")
```

In [132…
```
dls_orig = TextDataLoaders.from_df(train_orig, path="./", text_col='tweet', valid_pct=0.3, is_lm=True)
```

Model -- trained on `Trump-insult dataset 2014-2021`

In [134…
```
model_orig = language_model_learner(dls_orig, AWD_LSTM)
```

In [135…
```
model_orig.fit_one_cycle(5)
```

epoch	train_loss	valid_loss	time
0	5.112031	4.564421	08:20
1	4.637696	4.056053	08:11
2	4.311796	3.846397	08:14
3	4.140949	3.771640	08:12
4	4.078689	3.761346	08:09

In [ ]:
```
So this dataset is ~10k rows, so these 5 cycles complete in ~40 mins
```

Tweet Generating / Predicting using `Trump-insult dataset 2014-2021`

for the same pattern as "usa is greatest" *(as above)*

In [136…

```
model_orig.predict("usa is the greatest ", n_words=7)
```

Out[136…

```
'usa is the greatest man ever in America , together'
```

well... let's now see what a counter-narrative were to say... a diff version? *(as above)*

In [137…

```
model_orig.predict("i think i am ", n_words=7)
```

Out[137…

```
'i think i am fat , miners do not have in'
```

lets see fake news as input... *(as above)*

In [138…

```
model_orig.predict("you are fake news and you", n_words=7)
```

Out[138…

```
'you are fake news and you know what to do with them .'
```

In [139…

```
model_orig.predict("i love ", n_words=15)
```

Out[139…

```
'i love tour in the Wild , the play of Charlie Moore we see'
```

this time Trump doesn't sound "dreamy" rather **"ready to get back at it"..?**

When the model is trained on the dataset of Trump's own tweets, the generated tweet seem to match Trump's public image. With the different dataset, the tweets didn't exactly align or doesn't seem to be perceived the same way as intended. The difference in either datasets apart from the volume of rows, is the source of truth. Media tweets of trump are part of the dataset where the generated tweets seem "dreamy" unlike Trump
